

Automating Employee Data Management

Problem Statement

In many organizations, employee data is still managed through manual processes or fragmented systems such as spreadsheets, emails, and paper-based records. This leads to inefficiencies, data inconsistencies, and an increased risk of errors. As organizations grow, maintaining accurate and up-to-date employee information becomes more complex and time-consuming.

The absence of a centralized system makes it difficult for HR departments to manage employee records such as personal details, attendance, payroll, performance, and compliance data. Manual data entry often results in duplication, missing information, and delays in processing. Retrieving information for reporting, auditing, or decision-making becomes challenging and unreliable.

Furthermore, there is a lack of real-time data synchronization across departments like HR, finance, and management. This results in inconsistent and outdated information, negatively impacting organizational efficiency. Data security is also a major concern, as sensitive employee information may not be properly protected in manual systems.

To overcome these issues, there is a need for an automated employee data management system that centralizes and streamlines all employee-related information. Such a system should improve accuracy, reduce manual effort, and ensure secure and efficient data handling.

Objectives

The main objective of this project is to develop an automated system that efficiently manages employee data in a centralized and secure platform. The system aims to eliminate manual processes and improve accuracy, accessibility, and productivity.

One key objective is to centralize all employee information, including personal details, job roles, attendance, payroll, and performance records, into a single system. This ensures consistency and easy access to updated information across departments.

Another objective is to reduce human errors by automating data entry, updates, and processing. The system should support real-time data synchronization, enabling different departments to access accurate and current data.

The project also focuses on enhancing data security through role-based access control, ensuring that only authorized users can access sensitive information. This helps maintain confidentiality and compliance.

Additionally, the system should improve efficiency by enabling quick data retrieval, automated workflows, and report generation. It should support better decision-making through analytics and insights.

Finally, the system should be scalable, flexible, and capable of integrating with other systems such as payroll and attendance management, ensuring long-term usability and organizational growth.

Import data from data source

Epic

Complexity: Medium

Duration: 1h 40m

Description

The **Import Data from Data Source** process involves bringing external employee records into ServiceNow using Import Sets. An external file (Excel, CSV, or XML) containing employee details such as Name, Email, Department, and Manager is uploaded into a staging table. A Transform Map is then configured to map the imported fields to the User (sys_user) table. Once transformed, the employee records are inserted into the system, ensuring accurate and structured data integration without manual entry.

Resources

No resources available

Create records in the Sheet

Story Duration: 20m

In Progress

Description

- 1. Open google sheet
- 2. Name the fields as name,email,department manager and manager's email
- 3. Enter some records
- 4. Save the sheet as: employee data
- 5. Download the file as .xlsx , .csv (or) .xml file

Resources

No resources available

Import data

Story

Duration: 20m

● In Progress

Description

1. Open service now.
2. Click on All >> search for import sets
3. Select load data under system import sets
4. select create table
5. Give the the import set table name as: import employee
6. Choose the file which we created in the XL sheet.

- 8.Add fields to the form.

7.The data is imported,click on personalized list

8.Add fields to the form.

Create transform map

Story Duration: 20m

In Progress

Description

- 1. Open service now.
- 2. Click on All >> search for import set
- 3. Select create transform map under import sets
- 4. Click on new
- 5. Fill the following details to create a new transform map
- 6. Give name as: Employee data transform
- 7. Select source table: import employee data
- 8. Select target table: user[sys_user]

form.

Match the fields using mapping assist

Story Duration: 20m

In Progress

Description

- 1. Scrolled down the created transform map form
- 2. Click on auto matching fields
- 3. Then in the mapping fields some fields are matched

- 4. Using mapping assist map the manager field.
- 5. Select the fields which you are mapping in the staging table and target table

↓ manager in source table and add
↑ manager field in target table
↔ the save button.

Transform the Data

Story Duration: 20m

In Progress

Description

- 1. Click on transform in the related links.
- 2. Click on transform.
- 3. Data's transform state is completed.

ISSET0010003 under next steps
s are inserted.

Display department to the assigned to user

Story Duration: 30m

To Do

Description

- 1. Open service now.
- 2. Click on All >> Incident
- 3. Select create new under incidents
- 4. There is no field like department in the form
- 5. Email and manager fields are not visible

- 6. By using dot walking retrieve the data without opening the record
- 7. Click on context menu go to configure and select form layout
- 8. Select assigned to department as mentioned below
- 9. Click on save.

- 10. Add another field assignment.email.
- 11. Also add assignment.manager field
- 12. Click on save.

- 14. Open an incident form
- 15. Fill the mandatory fields and assigned to just imported user
- 16. Then department and email field is automatically filled

Make the state to 3-moderate in incident

In Progress

Story Duration: 30m

Description

1. Navigate to All → System Definition → Tables.
2. Either:
3. Use the existing Incident table (which extends Task), OR
4. Create a new table (e.g., u_incident_table) and set Extends Table = Task.
5. Open the Incident (or extended) table record.
6. Go to the Columns related list and open the Priority field. Notice the default value is inherited from the Task table (e.g., 4 – Low).

7. Scroll down and locate the Dictionary Overrides related list.

8. Click New under Dictionary Overrides.
9. Fill the following details:
10. Table: Incident (or your extended table)
11. Column name: Priority
12. Check Override default value
13. Set Default value = 3
14. Click Submit.

The screenshot shows the 'Dictionary Entry Override - Create priority' form in ServiceNow. The left sidebar contains a navigation menu with options like 'System Dictionary', 'Tables', and 'Columns'. The main form area is titled 'Dictionary Entry Override - Create priority' and includes a 'New record' button. The form contains several fields: 'Table' (set to 'Incident'), 'Column name' (set to 'Priority'), 'Override default value' (checked), and 'Default value' (set to '3'). There are also checkboxes for 'Override column label', 'Override column type', 'Override column format', 'Override column length', 'Override column precision', 'Override column scale', 'Override column unit', 'Override column display', 'Override column visibility', and 'Override column read-only'. A 'Submit' button is located at the top right of the form.

15. Open a new Incident record and verify that the Priority now defaults to 3 – Moderate, while the Task table still retains its original default value.

The screenshot shows the 'Incident table - Create TASK0000079' form in ServiceNow. The left sidebar contains a navigation menu with options like 'System Dictionary', 'Tables', and 'Columns'. The main form area is titled 'Incident table - Create TASK0000079' and includes a 'New record' button. The form contains several fields: 'Number' (set to 'TASK0000079'), 'Priority' (set to '3 - Moderate'), 'Status' (set to 'Open'), 'Form' (set to 'Incident'), 'Work order' (set to 'Incident'), 'Short description' (set to 'Incident'), 'Description' (set to 'Incident'), and 'Work order' (set to 'Incident'). A 'Submit' button is located at the bottom left of the form.

Conclusion - In detail

Story Duration: 10m

In Progress ▾

Description

In this project, we enhanced incident management by integrating external employee data into ServiceNow through Import Sets and Transform Maps, eliminating manual data entry and ensuring accurate user records. By leveraging dot walking, we enabled real-time visibility of related information such as department and manager details directly on the Incident form without duplicating data.

Additionally, the use of Dictionary Override allowed us to customize the default Priority value specifically for the Incident table while preserving the inherited behavior of the parent Task table. This ensured that incidents follow a priority structure aligned with business urgency without impacting other task-based processes.

Overall, the solution improves data accuracy, reduces administrative effort, and provides incident handlers with immediate access to critical contextual information. The combination of data integration, relational referencing, and table-level customization creates a more efficient, scalable, and structured incident resolution workflow within ServiceNow.
